

# Returns Processing System

featuring the Beck SXJ Adapt

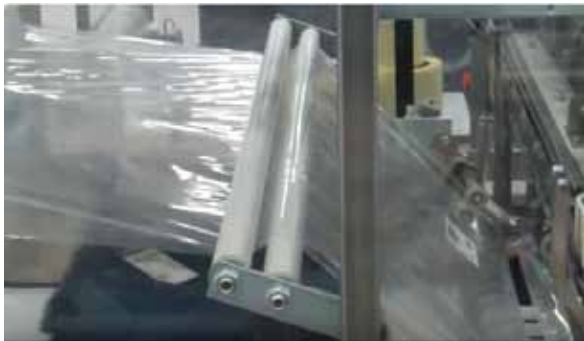

Returned merchandise arrives in a tote on the bottom conveyor.

Merchandise is then prepared with price ticket facing up and placed on upper in-feed conveyor.

The system spaces the merchandise and the camera scans the price ticket to gather label information.

Merchandise is wrapped in clear poly and corresponding label is printed and applied.

Path of merchandise is communicated through different labels.

Adapta feature right-sizes bag width for proper merchandise presentation.

Wrapped, labeled merchandise is conveyed to forward pick locations or back into stock.

**The Returns Processing System makes handling returns easier and more efficient, presenting merchandise as good as new!**
